Biomass Statistics for Maryland--1986

Reserved

Thomas S. Frieswyk Dawn M. DiGiovanni

ABSTRACT

A new measure of the forest resource has been added to the fourth forest inventory of Maryland. The inventory, which was conducted in 1985-86, included estimates of aboveground tree biomass on timberland. There are approximately 265 million green tons of wood and bark in the aboveground portion of all trees, an average of 109 green tons per acre statewide. Approximately 63 percent or 167 million green tons is in growing stock, and nearly 37 percent or 98 million green tons is nongrowing-stock (growing-stock tops, saplings, cull trees, and salvable dead trees) material.

FOREWORD

The fourth inventory of Maryland was under the overall direction of John R. Peters, Project Leader of the Forest Inventory and Analysis Unit. Thomas W. Birch assisted in the development and administration of the operating plan. Charles T. Scott was responsible for the design of the inventory and sample selection. David J. Alerich supervised the interpretation of aerial photos and collection of data. He was assisted by Joseph G. Reddan. Members of the field staff were:

Lisa A. Arbucci Theresa Arre Vanessa Artman-Bailey Michael J. Barton, Jr. Barron E. Burch, III Stephen M. Clark Dawn M. DiGiovanni Thomas V. Gabriel David W. Guest Roger L. Huber Robert E. Ilgenfritz Lawrence A. Ingerson Judith T. Keyes Ann K. Kessler Wayne R. Kettlewood Robert Kurilla

Jonathan W. Spencer
Tina J. Terrell
Robert Wells
Teresa L. Witzel

Thomas S. Frieswyk and Dawn M. DiGiovanni applied FINSYS (Forest INventory SYStem), a generalized data processing system, to the specific needs of the Maryland inventory and produced summary tables for the state and counties. Thomas W. Birch and Dawn M. DiGiovanni were instrumental in assuring that the area estimates were consistent with the two previous inventories. Rosemary K. Venit produced graphics and was involved in rewriting parts of the FINSYS table generating routine.

Marie Pennestri was responsible for administrative and secretarial services. Dorelle Smith typed the text for this report.

The Forest Inventory and Analysis Unit would like to thank the landowners of Maryland for their cooperation and assistance during this inventory.

Highlights

All Trees

- Dry weight averages 56 percent of green weight for all species on a statewide basis.
- There are more than 265 million green tons of aboveground biomass in all trees. Over 98 percent, or 260 million green tons, is in live trees.
- Growing stock accounts for 167 million tons, 63 percent of the net green weight of all trees.
- Nongrowing stock accounts for 98 million tons, or 37 percent of the net green weight of all trees. Fifty-nine percent of the nongrowing stock is in growing-stock tops, 16 percent is in rough and rotten cull trees, 20 percent is in saplings, and 5 percent is in salvable dead trees.
- Hardwoods make up 86 percent, or 227 million green tons, of the net aboveground biomass of all trees.
- Net aboveground biomass for all trees averages 109 green tons per acre in Maryland, and ranges from a low of 83 green tons per acre in Wicomico County to a high of 146 green tons per acre in Caroline/Talbot Counties.

All Live Trees

- Sawtimber stands contain 216 million green tons, or 83 percent, of aboveground biomass of all-live trees.
- The Oak/hickory forest-type group contains the largest amount of aboveground tree biomass (170 million green tons).
- Red maple is the leading species in terms of aboveground biomass as well as cubic-foot volume. This species accounts for 11 percent of the aboveground biomass of all live trees. Loblolly pine is the leading softwood species and accounts for 8 percent of the aboveground biomass.

Cull and Salvable Dead

- Cull and salvable dead trees average 8.2 green tons per acre of timberland, and range from a low of 3 green tons per acre in Wicomico County to a high of 14 green tons per acre in Allegany County.
- The Elm/ash/red maple forest-type group has the highest average tons per acre (13.3) of cull and salvable dead material. The Loblolly/shortleaf group has the lowest average at just 3.1 tons per acre.

Introduction

The USDA Forest Service completed the fourth inventory of Maryland's forest resources in 1986. Previous inventories were conducted in 1950, 1964, and 1976.

The inventories are conducted under the authority of the McSweeney-McNary Forest Research Act of 1928 and subsequent acts including the Renewable Resources Planning Act of 1974 and the Renewable Resources Research Act of 1978.

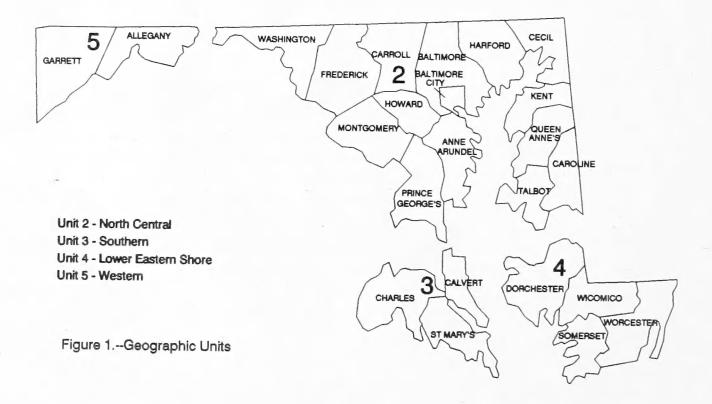

The statistics presented in this report are a summary of data collected on new field plots established during the fourth inventory and on a remeasured subsample of plots established during the previous inventories. The new-plot sample consisted of 602 ground plots randomly selected from 18,355 photo points classified by land use and cubic-foot volume class. The remeasured sample consisted of 550 plots from the third survey. A total of 1,152 points was sampled for an average of one plot for every 5,465 acres of land area.

Data were collected, processed, and analyzed by the Forest Inventory and Analysis staff. A complete list of available biomass tables is included in this report. These tables are available on microfiche by state, geographic unit (Fig. 1), and county. Other tables or additional information may be developed. For further information, contact the Forest Inventory and Analysis Unit, USDA Forest Service, 100 Matsonford Road, Radnor, PA 19087 (215-975-4074).

Methods

Traditionally, forest resource data have been collected to describe the forest in terms of its timber production capabilities. Board-foot and cubic-foot measures of volume (Fig. 2) were and are adequate for that purpose.

Although timber production is still considered by many to be the primary use of forest land, there are many data users that are also interested in how the resource can be used for energy production, fiberbased products, wildlife, or recreation. Because board-foot and cubic-foot volume estimates do not describe the forest resource broadly enough, biomass estimates have been built into the standard USDA Forest Service inventory procedure (Fig. 2).

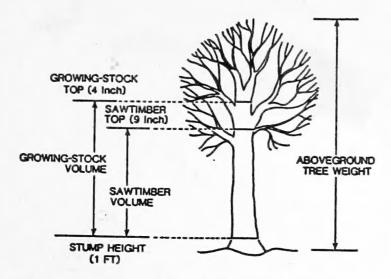

Figure 2.--Volume and weight relationships of hardwood aboveground tree biomass components.

Users of biomass data are interested in both green and dry weight as well as in the weight of various tree components. Two criteria were established for selecting a set of biomass equations to cover the species encountered in the Northeast. First, the biomass equations must provide both green weight and dry weight, and second, the selected equations must use only diameter at breast height as an independent variable.

Three sets of regression equations were chosen from the literature that fit the two criteria: Monteith (1979) collected data from New York, Wiant and others (1977) collected data from West Virginia, and Young and others collected data from Maine. The equations cover the range of species encountered in the Northeast. Where a regression equation for a species has been published by more than one author, Young and others (1980) is used as the primary source, followed by Wiant and others (1977) and Monteith (1979).

Young and others (1980) is the source of tree biomass regression functions for softwoods: balsam fir, eastern white pine, red pine, spruce, hemlock, northern white-cedar, and larch. The source of tree-biomass regression functions for hardwoods is: red maple, yellow birch, and aspen from Young and others (1980); sugar maple, American beech, and white ash from Monteith (1979); hickory, yellow-poplar, black cherry, white oak, scarlet oak, chest-nut oak, northern red oak, and black oak from Wiant and others (1977).

Although all of the equations provide an estimate of total tree biomass (above stump), each equation uses different standards. Monteith's equation (3) assumes a 1-foot stump, whereas Wiant's (2) and Young's (1) equations assume a 6-inch stump. Also, foliage weight may be included or ignored depending on which equation is being used:

$$Ln Y = b_0 + b_1 Ln(D)$$
 (1)

$$LOG_{10}Y = LOG_{10}b_0 + b_1LOG_{10}(D)$$
 (2)

where:

Y = green weight in pounds

D = diameter at breast height in inches

$$Y = b_0 + b_1(D) + b_2(D)^2$$
 (3)

where:

Y = green weight in kilograms

D = diameter at breast height in millimeters

The weights in stumps and foliage are commonly quite small, and in the case of foliage weight, variation is too great to develop meaningful averages (Keays 1971). Therefore, biomass statistics resulting from the use of the selected equations may be slightly over- or under-estimated depending on the species. The form of the equations is shown in the previous tabulation and the regression coefficients can be found on page 9.

All species that did not have specific biomass coefficients were grouped with species that had similar green and dry densities. (See page 10.)

The weight of the merchantable stem was derived by multiplying the total tree weight by a calculated percentage. The percentage is diameter and softwood/hardwood dependent and is based on historical inventory data. The estimate for tops and branches was developed by taking the difference between above-stump biomass from the weight regression equations and the independent estimate of merchantable stem biomass.

Estimates of area, volume, and aboveground tree biomass have been summarized in this report. The statistics are presented by forest-type group, species or species group, and diameter group and are provided at the state and county level.

FINANCIA MARTINIA MAR

Reliability of Estimates

The data in this report were based on a carefully designed sample of forest conditions throughout Maryland. The field crews did not measure every tree nor examine every acre in the State and so the data are estimates. Therefore, zeros in any table cell indicate that the condition did not appear in the sample, or that the amount encountered was negligible. They do not necessarily mean that the condition does not exist.

There are two important sources of error to consider when looking at the estimates provided in this report: (1) the error associated with estimation from sample plots, and (2) the error associated with combining independent estimates. Some of the errors associated with estimation from sample plots are included in the tables and are called sampling error. We are not able to calculate a value for the error associated with combining independent estimates.

Briefly, here is an example of how the sampling error is used to indicate reliability. The estimate of above-ground biomass of all trees on timberland in Maryland is 265 million green tons. It has an associated sampling error of 2.7 percent, or 7.2 million green tons. This means that if the survey were repeated, the odds are 2 to 1 (66 percent probability) that the estimate would be between 257.8 and 272.2 million green tons (265 + 7.2). Similarly, the odds are 19 to 1 (95 percent probability) that the estimate would be within + 14.4 million green tons.

State estimates have the smallest sampling errors and therefore are the most reliable. Geographic unit estimates are the next most reliable followed by county estimates. For example, the sampling error of aboveground tree biomass for Maryland is 2.7 percent, while the sampling error for Allegany County is 5.7 percent. County estimates are expected to be considerably less reliable than state estimates. The state estimates are based on a larger sample than county estimates, and as the sample size used to obtain the estimate decreases in relation to the population size, the sampling error is expected to increase.

Some of the estimates have sampling errors that are greater than 25 percent and may not be useable. Any estimate with a sampling error of 50 percent or more would not be significantly different from zero.

and those estimates with errors between 25 and 50 percent are suspect. Therefore, any estimates that have errors exceeding 25 percent should be used with caution.

The second important source of error occurs when two independent estimates are used to derive a third estimate. The biomass in tops and branches has been derived in this manner. The estimate of the merchantable stem biomass was subtracted from the estimate of total above-stump biomass to yield and estimate of the biomass in tops and branches. Consequently, the estimates of tops and branches should be used with caution.

Definition of Terms

Board foot. A unit of lumber measurement 1 foot long, 1 foot wide, and 1 inch thick, or its equivalent.

Commercial species. Tree species presently or prospectively suitable for industrial wood products. Excludes species of typically small size, poor form, or inferior quality, such as hawthorn or sumac.

Cull tree. A rough tree or a rotten tree.

Diameter at breast height (d.b.h.). The diameter outside bark of a standing tree measured at 4-1/2 feet above the ground.

Dry weight. The weight of wood and bark, oven-dry basis. It is usually expressed in pounds or tons.

Forest land. Land that is at least 10 percent stocked with trees of any size, or that formerly had such tree cover and is not currently developed for a nonforest use. The minimum area for classification of forest land is 1 acre.

Forest type. A classification of forest land based on the species that form a plurality of live tree basalarea stocking.

Forest-type group. A combination of forest types that share closely associated species or site requirements. The many forest types in Maryland were combined into the following major forest-type groups (the descriptions apply to forests in Maryland):

a. White/red pine--forests in which white pine, hemlock, or red pine make up the plurality of the stocking, singly or in combination; common associates include maple, oak, and yellow-poplar.

b. Spruce/fir--forests in which red spruce, northern white-cedar, balsam fir, white spruce, black spruce, or tamarack, singly or in combination, make up a plurality of the stocking; common associates include paper birch, red maple, aspen, white pine, hemlock, and sugar maple.

c. Loblolly/shortleaf pine group--forests in which loblolly, shortleaf or other southern yellow pines (except longleaf or slash pine) singly or in combination, comprise a plurality of the stocking; common associates include oaks, red maple, and blackgum.

d. Oak/pine--forests in which northern red oak or white ash, singly or in combination, make up a plurality of the stocking but where pine or eastern red-cedar contributes 25 to 50 percent of the stocking; Virginia and loblolly pine, southern red oak, hickory, and blackgum are associates.

e. Oak/hickory--forests in which upland oaks, red maple (when associated with central hardwoods), or hawthorn, singly or in combination, make up a plurality of the stocking and in which white pine makes up less than 25 percent of the stocking; common associates include hard pine, ash, yellow-poplar, beech, blackgum, sugar maple, and red maple.

f. Oak/gum/cypress--bottomland forests in which wet-site oaks, sweetgum, or baldcypress, singly or in combination, comprise a plurality of the stocking and in which pine comprises less than 25 percent of the stocking; common associates include American elm, red maple, blackgum, and green ash.

g. Elm/ash/red maple--forests in which black ash, elm, red maple (when growing on wet sites), willow, or green ash, singly or in combination, make up a plurality of the stocking; common associates include bottomland oak, blackgum, river birch, and silver maple.

h. Northern hardwoods--forests in which sugar maple, beech, yellow birch, red maple (when

associated with northern hardwoods), pin cherry, or black cherry, singly or in combination, make up a plurality of the stocking; common associates include red maple, northern red oak, hemlock, white ash, and basswood.

Geographic unit. A county or a group of counties within a state that is large enough to provide an adequate sample that will yield statistically reliable estimates of timberland area, volume, and components of change.

Green ton. A unit of measure of green weight equivalent to 2,000 pounds or 907.1848 kilograms.

Green ton stand-volume class. A classification of forest land in terms of net green weight of the aboveground components of all live trees per unit area. It is usually expressed in green tons per acre.

Green weight. The weight of wood and bark as it would be if it had been recently cut. It is usually expressed in pounds or tons.

Growing-stock trees. Live trees of commercial species classified as sawtimber, poletimber, saplings, or seedlings; that is, all live trees of commercial species except rough and rotten trees.

Growing-stock volume. Net volume, in cubic feet, of growing-stock trees 5.0 inches d.b.h. and larger from a 1-foot stump to a minimum 4.0-inch top diameter outside bark of the central stem, or to the point where the central stem breaks into limbs. Net volume equals gross volume, less deduction for cull.

Hardwoods. Dicotyledonous trees, usually broadleaved and deciduous.

Land area. (a) Bureau of Census: The area of dry land and land temporarily or partly covered by water, such as marshes, swamps, and river flood plains; streams, sloughs, estuaries, and canals less than 1/8 statute mile wide; and lakes, reservoirs, and ponds less than 40 acres in area. (b) Forest Inventory and Analysis: same as (a) except that the minimum width of streams, and so on, is 120 feet, and the minimum size of lakes, and so on, is 1 acre.

Net green weight. The green weight of woody material less the weight of all unsound (rotten) material.

Noncommercial forest land. Productive-reserved, urban, and unproductive forest land.

Noncommercial species. Tree species of typically small size, poor form, or inferior quality that normally do not develop into trees suitable for industrial wood products.

Nonforest land. Land that has never supported forests, or land formerly forested but now in nonforest use such as cropland, pasture, residential areas, and highways.

Nonsalvable dead tree. A dead tree with most or all of its bark missing that is at least 5.0 inches in diameter at breast height and is at least 10 feet in height.

Ownership class. A classification of forest land based upon ownership and nature of business or control of decisionmaking for the land. It encompasses all types of legal entities having ownership interest in the land, whether public or private.

Poletimber stand. A stand-size class of forest land that is stocked with at least 10 percent of full stocking with all live trees with half or more of such stocking in poletimber or sawtimber trees or both, and in which the stocking of poletimber exceeds that of sawtimber.

Poletimber tree. Live trees of commercial species meeting regional specifications of soundness and form and at least 5.0 inches d.b.h., but smaller than sawtimber trees.

Rotten tree. A live tree of commercial species that does not contain at least one 12-foot sawlog or two noncontiguous sawlogs, each 8 feet or longer, now or prospectively, and does not meet regional specifications for freedom from defect primarily because of rot; that is, more than 50 percent of the cull volume in the tree is rotten.

Rough tree. (a) The same as a rotten tree, except that a rough tree does not meet regional specifications for freedom from defect primarily because of roughness or poor form; also (b) a live tree of non-commercial species.

Salvable dead trees. A tree at least 5.0 inches in d.b.h. that has recently died and still has intact bark.

The tree may be standing, fallen, windthrown, knocked down, or broken off.

Sampling error. A measure of the reliability of an estimate, expressed as a percentage of the estimate. The sampling errors given in this report correspond to one standard deviation and are calculated as the square root of the variance, divided by the estimate, and multiplied by 100.

Saplings. Live trees 1.0 inch through 4.9 inches d.b.h.

Sapling-seedling stand. A stand-size class of forest land that is stocked with at least 10 percent of full stocking with all live trees, with half or more of such stocking in saplings or seedlings or both.

Sawlog. A log meeting regional standards of diameter, length, and freedom from defect, including a minimum 8-foot length and a minimum diameter inside bark of 6 inches for softwoods and 8 inches for hardwoods.

Sawlog portion. That part of the bole of a sawtimber tree between the stump and the sawlog top; that is, the merchantable height.

Sawlog top. The point on the bole of a sawtimber tree above which a sawlog cannot be produced. The minimum sawlog top is 7.0 inches diameter outside bark (d.o.b.) for softwoods and 9.0 inches d.o.b. for hardwoods.

Sawtimber stand. A stand-size class of forest land that is stocked with at least 10 percent of full stocking with all live trees with half or more of such stocking in poletimber or sawtimber trees or both, and in which the stocking of sawtimber is at least equal to that of poletimber.

Sawtimber trees. Live trees of commercial species at least 9.0 inches d.b.h. for softwoods or 11.0 inches for hardwoods, containing at least one 12-foot sawlog or two noncontiguous 8-foot sawlogs, and meeting regional specifications for freedom from defect.

Sawtimber volume. Net volume in board feet, by the International 1/4-inch rule, of sawlogs in sawtimber trees. Net volume equals gross volume less deductions for rot, sweep, and other defects that affect use for lumber.

Seedlings. Live trees less than 1.0-inch d.b.h. and at least 1 foot in height.

Softwoods. Coniferous trees, usually evergreen and having needles or scalelike leaves.

Stand. A group of forest trees growing on forest land.

Stand area class. The area, contiguous to the plot, that is of the same overall stand size and major type group (hardwood, softwood, or uniform mixture of both).

Stand-size class. A classification of forest land based on the size class (that is, seedlings, saplings, poletimber, or sawtimber) of all live trees in the area.

Stocking. The degree of occupancy of land by trees, measured by basal area and/or number of trees in a stand compared to the basal area and/or number of trees required to fully use the growth potential of the land (or the stocking standard). In the Eastern United States this standard is 75 square feet of basal area per acre for trees 5.0 inches d.b.h. and larger, or its equivalent in numbers of trees per acre for seedlings and saplings.

Two categories of stocking are used in this report: all live trees and growing-stock trees. The relationships between the classes and the percentage of the stocking standard are: nonstocked = 0 to 9, poorly stocked = 10 to 59, moderately stocked = 60 to 99, fully stocked = 100 to 129, and overstocked = 130 to 160.

Stump. The main stem of a tree from ground level to 1 foot above ground level, including the wood and bark.

Timberland. Forest land producing or capable of producing crops of industrial wood (more than 20 cubic feet per acre per year) and not withdrawn from timber utilization. Formerly known as commercial forest land.

Top. The wood and bark of a tree above the merchantable height (or above the point on the stem 4.0 inches in diameter outside bark). It generally includes the uppermost stem, branches, and twigs of the tree, but not the foliage.

Tree class. A classification of the quality or condition of trees for sawlog production. Tree class for sawtimber trees is based on their present condition. Tree class for poletimber trees is a prospective determination--a forecast of their potential quality when they reach sawtimber size (11.0 inches d.b.h. for hardwoods, 9.0 inches d.b.h. for softwoods).

Trees. Woody plants that have well-developed stems and are usually more than 12 feet in height at maturity.

Upper-stem portion. That part of the main stem or fork of a sawtimber tree above the sawlog top to a diameter of 4.0 inches outside bark, or to the point where the main stem or fork breaks into limbs.

^{***} Names according to: Little, Elbert L., Jr. Checklist of United States Trees (native and naturalized). Agric. Handb. 541 Washington, DC: U.S. Department of Agriculture, Forest Service. 1979. 375 p. **Occurence is based on the proportion of the species among all live trees 5.0 inches d.b.h. or larger encountered on forest survey field plots: vr = very rare (0.05%). r = rare (0.05 to 0.49%), c = common (0.5 to 4.9%), and vc = very common (>5,0%) *Noncommercial species.

Metric Equivalents

```
1 acre = 4,046.86 square meters
1 acre = 0.404686 hectares
1,000 \text{ acres} = 404,686 \text{ hectares}
1,000,000 \text{ acres} = 404,686 \text{ hectares}
1 board foot = 0.00348 cubic meters
1 board feet = 3.480 cubic meters
1,000 board feet = 3.48 cubic meters
1,000,000 board feet = 3,480 cubic meters
1 cubic foot = 0.028317 cubic meters
1.000 cubic feet = 28.317 cubic meters
1 cord (wood, bark, and air space) = 3.6246 cubic meters
1 cord (solid wood, pulpwood) = 2.4069 cubic meters
1 cord (solid wood, other than pulpwood) = 2.2654 cubic meters
1,000 cords (pulpwood) = 2,406.9 cubic meters
1,000 \text{ cords (other products)} = 2,265,4 \text{ cubic meters}
1 inch = 2.54 centimeters or 0.0254 meters
1 foot = 30.48 centimeters or 0.3048 meters
1 mile = 1.609 kilometers
1 square foot = 929.03 square centimeters or
1 square foot per acre basal area = 0.229568 square meters per
hectare
1 \text{ ton} = 907.1848 \text{ kilograms}
1,000 \text{ tons} = 907.1848 \text{ metric tons}
Breast height = 1.4 meters above ground level
```

Although 1,000 board feet is theoretically equivalent to 2.36 cubic meters, this is true only when a board foot is actually a piece of wood with a volume 1/12 of a cubic foot. The International 1/4-inch log rule is used by the USDA Forest Service in the East to estimate the product potential in board feet. The reliability of the estimate obtained by conversion will vary with the size of the log measure. The conversion given here, 3.48 cubic meters, is based on the cubic volume of a log 16 feet long and 15 inches in diameter inside bark (d.i.b.) at the small end. This conversion could be used for average comparisons when accuracy of 10 percent is acceptable. Because the board foot unit is not a true measure of wood volume and because products other than dimension lumber are becoming important, this unit may eventually be phased out and replaced by the cubic meter.

List of Available Biomass Tables

The following biomass tables are on microfiche. These tables are available at the state, geographic unit, and county level for both green and dry weight. Copies of fiche or photocopies of particular tables can be obtained by calling or writing

USDA Forest Service Forest Inventory and Analysis 100 Matsonford Road Radnor, PA 19087 (215-975-4074)

Table description

- 1. Softwood aboveground biomass by diameter class and stand-size class.
- 2. Hardwood aboveground biomass by diameter class and stand-size class.
- 3. Net weight (tons) of all trees on timberland by class of materials and softwoods and hardwoods.
- 4. Net weight (tons) of all live trees on timberland by species and diameter group.
- Net weight (tons) of merchantable stem of growing stock trees on timberland by species and diameter class.
- 6. Net weight (tons) of growing stock trees on timberland by species and diameter class.
- 7. Net weight (tons) of all live trees on timberland by species and diameter group.
- 8. Net weight (tons) of all live trees on timberland by components and age class.
- 9. Net weight (tons) of all live trees on timberland by forest type and stand-size class.
- 10. Net weight (tons) of all live trees on timberland by forest-type group and stand-size class.
- 11. Net weight (tons) of all live trees on timberland by timber management class and forest-type group.
- 12. Net weight (tons) of all live trees on timberland by timber management class and standard area class.
- 13. Net weight (tons) of cull and salvable dead trees on timberland by forest-type group and stand-size class.
- 14. Net weight (tons) of cull and salvable dead trees 5"+ on timberland by species group and diameter group.
- 15. Net weight (tons) of cull and salvable dead trees on timberland by component type of tree and softwoods/hardwoods.

Index to Tables

The tables are divided into three sections: (1) net volume and aboveground biomass of all trees, (2) net aboveground biomass of all live trees and (3) net aboveground biomass of cull and salvable dead trees.

All Trees

- Net volume of growing stock, sawtimber, and aboveground tree biomass of all trees on timberland, by county and species group, Maryland, 1986.
- Area of timberland, net aboveground tree biomass of all trees on timberland, and net aboveground tree biomass per acre of timberland, by county, Maryland, 1986.
- 3. Net aboveground tree biomass of all trees on timberland, by class of material and species group, Maryland, 1986.
- Net aboveground tree biomass of all trees on timberland, by class of material and species group, Allegany County, Maryland, 1986.
- Net aboveground tree biomass of all trees on timberland, by class of material and species group, Baltimore County, Maryland, 1986.
- 6. Net aboveground tree biomass of all trees on timberland, by class of material and species group, Calvert County, Maryland, 1986.
- 7. Net aboveground tree biomass of all trees on timberland, by class of material and species group, Carroll County, Maryland, 1986.
- 8. Net aboveground tree biomass of all trees on timberland, by class of material and species group, Charles County, Maryland, 1986.

- Net aboveground tree biomass of all trees on timberland, by class of material and species group, Dorchester County, Maryland, 1986.
- Net aboveground tree biomass of all trees on timberland, by class of material and species group, Frederick County, Maryland, 1986.
- 11. Net aboveground tree biomass of all trees on timberland, by class of material and species group, Garrett County, Maryland, 1986.
- 12. Net aboveground tree biomass of all trees on timberland, by class of material and species group, St. Marys County, Maryland, 1986.
- Net aboveground tree biomass of all trees on timberland, by class of material and species group, Somerset County, Maryland, 1986.
- 14. Net aboveground tree biomass of all trees on timberland, by class of material and species group, Washington County, Maryland, 1986.
- 15. Net aboveground tree biomass of all trees on timberland, by class of material and species group, Wicomico County, Maryland, 1986.
- Net aboveground tree biomass of all trees on timberland, by class of material and species group, Worcester County, Maryland, 1986.
- 17. Net aboveground tree biomass of all trees on timberland, by class of material and species group, Anne Arundel/Howard Counties, Maryland, 1986.
- Net aboveground tree biomass of all trees on timberland, by class of material and species group, Caroline/Talbot Counties, Maryland, 1986.
- Net aboveground tree biomass of all trees on timberland, by class of material and

- species group, Cecil/Harford Counties, Maryland, 1986.
- Net aboveground tree biomass of all trees on timberland, by class of material and species group, Kent/Queen Annes Counties, Maryland, 1986.
- 21. Net aboveground tree biomass of all trees on timberland, by class of material and species group, Montgomery/Prince Georges Counties, Maryland, 1986.

Live Trees

- 22. Net aboveground tree biomass of all live trees on timberland, by forest-type group and stand-size class, Maryland, 1986.
- 23. Net aboveground tree biomass of all live trees on timberland, by forest-type group and stand-size class, Allegany County, Maryland, 1986.
- 24. Net aboveground tree biomass of all live trees on timberland, by forest-type group and stand-size class, Baltimore County, Maryland, 1986.
- 25. Net aboveground tree biomass of all live trees on timberland, by forest-type group and stand-size class, Calvert County, Maryland, 1986.
- 26. Net aboveground tree biomass of all live trees on timberland, by forest-type group and stand-size class, Carroll County, Maryland, 1986.
- 27. Net aboveground tree biomass of all live trees on timberland, by forest-type group and stand-size class, Charles County, Maryland, 1986.
- 28. Net aboveground tree biomass of all live trees on timberland, by forest-type group and stand-size class, Dorchester County, Maryland, 1986.
- 29. Net aboveground tree biomass of all live trees on timberland, by forest-type group and stand-size class, Frederick County, Maryland, 1986.

- 30. Net aboveground tree biomass of all live trees on timberland, by forest-type group and stand-size class, Garrett County, Maryland, 1986.
- 31. Net aboveground tree biomass of all live trees on timberland, by forest-type group and stand-size class, St. Marys County, Maryland, 1986.
- 32. Net aboveground tree biomass of all live trees on timberland, by forest-type group and stand-size class, Somerset County, Maryland, 1986.
- 33. Net aboveground tree biomass of all live trees on timberland, by forest-type group and stand-size class, Washington County, Maryland, 1986.
- 34. Net aboveground tree biomass of all live trees on timberland, by forest-type group and stand-size class, Wicomico County, Maryland, 1986.
- 35. Net aboveground tree biomass of all live trees on timberland, by forest-type group and stand-size class, Worcester County, Maryland, 1986.
- 36. Net aboveground tree biomass of all live trees on timberland, by forest-type group and stand-size class, Anne Arundel/ Howard Counties, Maryland, 1986.
- 37. Net aboveground tree biomass of all live trees on timberland, by forest-type group and stand-size class, Caroline/Talbot Counties, Maryland, 1986.
- 38. Net aboveground tree biomass of all live trees on timberland, by forest-type group and stand-size class, Cecil/Harford Counties, Maryland, 1986.
- 39. Net aboveground tree biomass of all live trees on timberland, by forest-type group and stand-size class, Kent/Queen Annes Countiés, Maryland, 1986.
- 40. Net aboveground tree biomass of all live trees on timberland, by forest-type group

- and stand-size class, Montgomery/Prince Georges Counties, Maryland, 1986.
- 41. Net aboveground tree biomass of all live trees on timberland, by species and diameter group, Maryland, 1986.
- 42. Net aboveground tree biomass of all live trees on timberland, by species and diameter group, Allegany County, Maryland, 1986.
- 43. Net aboveground tree biomass of all live trees on timberland, by species and diameter group, Baltimore County, Maryland, 1986.
- 44. Net aboveground tree biomass of all live trees on timberland, by species and diameter group, Calvert County, Maryland, 1986.
- 45. Net aboveground tree biomass of all live trees on timberland, by species and diameter group, Carroll County, Maryland, 1986.
- 46. Net aboveground tree biomass of all live trees on timberland, by species and diameter group, Charles County, Maryland, 1986.
- 47. Net aboveground tree biomass of all live trees on timberland, by species and diameter group, Dorchester County, Maryland, 1986.
- 48. Net aboveground tree biomass of all live trees on timberland, by species and diameter group, Frederick County, Maryland, 1986.
- 49. Net aboveground tree biomass of all live trees on timberland, by species and diameter group, Garrett County, Maryland, 1986.
- 50. Net aboveground tree biomass of all live trees on timberland, by species and diameter group, St. Marys County, Maryland, 1986.

- 51. Net aboveground tree biomass of all live trees on timberland, by species and diameter group, Somerset County, Maryland, 1986.
- 52. Net aboveground tree biomass of all live trees on timberland, by species and diameter group, Washington County, Maryland, 1986.
- 53. Net aboveground tree biomass of all live trees on timberland, by species and diameter group, Wicomico County, Maryland, 1986.
- 54. Net aboveground tree biomass of all live trees on timberland, by species and diameter group, Worcester County, Maryland, 1986.
- 55. Net aboveground tree biomass of all live trees on timberland, by species and diameter group, Anne Arundel/Howard Counties, Maryland, 1986.
- 56. Net aboveground tree biomass of all live trees on timberland, by species and diameter group, Caroline/Talbot Counties, Maryland, 1986.
- 57. Net aboveground tree biomass of all live trees on timberland, by species and diameter group, Cecil/Harford Counties, Maryland, 1986.
- 58. Net aboveground tree biomass of all live trees on timberland, by species and diameter group, Kent/Queen Annes Counties, Maryland, 1986.
- 59. Net aboveground tree biomass of all live trees on timberland, by species and diameter group, Montgomery/Prince Georges Counties, Maryland, 1986.

Cull and Salvable Dead Trees

60. Net aboveground tree biomass of cull and salvable dead trees (5.0+ inches d.b.h.) on timberland, by forest-type group and stand-size class, Maryland, 1986.

- 61. Net aboveground tree biomass of cull and salvable dead trees (5.0+ inches d.b.h.) on timberland, by forest-type group and stand-size class, Allegany County, Maryland, 1986.
- 62. Net aboveground tree biomass of cull and salvable dead trees (5.0+ inches d.b.h.) on timberland, by forest-type group and stand-size class, Baltimore County, Maryland, 1986.
- 63. Net aboveground tree biomass of cull and salvable dead trees (5.0+ inches d.b.h.) on timberland, by forest-type group and stand-size class, Calvert County, Maryland, 1986.
- 64. Net aboveground tree biomass of cull and salvable dead trees (5.0+ inches d.b.h.) on timberland, by forest-type group and stand-size class, Carroll County, Maryland, 1986.
- 65. Net aboveground tree biomass of cull and salvable dead trees (5.0+ inches d.b.h.) on timberland, by forest-type group and stand-size class, Charles County, Maryland, 1986.
- 66. Net aboveground tree biomass of cull and salvable dead trees (5.0+ inches d.b.h.) on timberland, by forest-type group and stand-size class, Dorchester County, Maryland, 1986.
- 67. Net aboveground tree biomass of cull and salvable dead trees (5.0+ inches d.b.h.) on timberland, by forest-type group and stand-size class, Frederick County, Maryland, 1986.
- 68. Net aboveground tree biomass of cull and salvable dead trees (5.0+ inches d.b.h.) on timberland, by forest-type group and stand-size class, Garrett County, Maryland, 1986.
- 69. Net aboveground tree biomass of cull and salvable dead trees (5.0+ inches d.b.h.) on timberland, by forest-type group and stand-size class, St. Marys County, Maryland, 1986.

- 70. Net aboveground tree biomass of cull and salvable dead trees (5.0+ inches d.b.h.) on timberland, by forest-type group and stand-size class, Somerset County, Maryland, 1986.
- 71. Net aboveground tree biomass of cull and salvable dead trees (5.0+ inches d.b.h.) on timberland, by forest-type group and stand-size class, Washington County, Maryland, 1986.
- 72. Net aboveground tree biomass of cull and salvable dead trees (5.0+ inches d.b.h.) on timberland, by forest-type group and stand-size class, Wicomico County, Maryland, 1986.
- 73. Net aboveground tree biomass of cull and salvable dead trees (5.0+ inches d.b.h.) on timberland, by forest-type group and stand-size class, Worcester County, Maryland, 1986.
- 74. Net aboveground tree biomass of cull and salvable dead trees (5.0+ inches d.b.h.) on timberland, by forest-type group and stand-size class, Anne Arundel/Howard Counties, Maryland, 1986.
- 75. Net aboveground tree biomass of cull and salvable dead trees (5.0+ inches d.b.h.) on timberland, by forest-type group and stand-size class, Caroline/Talbot Counties, Maryland, 1986.
- 76. Net aboveground tree biomass of cull and salvable dead trees (5.0+ inches d.b.h.) on timberland, by forest-type group and stand-size class, Cecil/Harford Counties, Maryland, 1986.
- 77. Net aboveground tree biomass of cull and salvable dead trees (5.0+ inches d.b.h.) on timberland, by forest-type group and stand-size class, Kent/Queen Annes Counties, Maryland, 1986.
- 78. Net aboveground tree biomass of cull and salvable dead trees (5.0+ inches d.b.h.) on timberland, by forest-type group and stand-size class, Montgomery/Prince Georges Counties, Maryland, 1986.

- 79. Net aboveground tree biomass of cull and salvable dead trees on timberland, by species group and diameter group, Maryland, 1986.
- 80. Net aboveground tree biomass of cull and salvable dead trees on timberland, by species group and diameter group, Allegany County, Maryland, 1986.
- 81. Net aboveground tree biomass of cull and salvable dead trees on timberland, by species group and diameter group, Baltimore County, Maryland, 1986.
- 82. Net aboveground tree biomass of cull and salvable dead trees on timberland, by species group and diameter group, Calvert County, Maryland, 1986.
- 83. Net aboveground tree biomass of cull and salvable dead trees on timberland, by species group and diameter group, Carroll County, Maryland, 1986.
- 84. Net aboveground tree biomass of cull and salvable dead trees on timberland, by species group and diameter group, Charles County, Maryland, 1986.
- 85. Net aboveground tree biomass of cull and salvable dead trees on timberland, by species group and diameter group, Dorchester County, Maryland, 1986.
- 86. Net aboveground tree biomass of cull and salvable dead trees on timberland, by species group and diameter group, Frederick County, Maryland, 1986.
- 87. Net aboveground tree biomass of cull and salvable dead trees on timberland, by species group and diameter group, Garrett County, Maryland, 1986.
- 88. Net aboveground tree biomass of cull and salvable dead trees on timberland, by

- species group and diameter group, St. Marys, County, Maryland, 1986.
- 89. Net aboveground tree biomass of cull and salvable dead trees on timberland, by species group and diameter group, Somerset County, Maryland, 1986.
- 90. Net aboveground tree biomass of cull and salvable dead trees on timberland, by species group and diameter group, Washington County, Maryland, 1986.
- 91. Net aboveground tree biomass of cull and salvable dead trees on timberland, by species group and diameter group, Wicomico County, Maryland, 1986.
- 92. Net aboveground tree biomass of cull and salvable dead trees on timberland, by species group and diameter group, Worcester County, Maryland, 1986.
- 93. Net aboveground tree biomass of cull and salvable dead trees on timberland, by species group and diameter group, Anne Arundel/Howard Counties, Maryland, 1986.
- 94. Net aboveground tree biomass of cull and salvable dead trees on timberland, by species group and diameter group, Caroline/Talbot County, Maryland, 1986.
- 95. Net aboveground tree biomass of cull and salvable dead trees on timberland, by species group and diameter group, Cecil/Harford Counties Maryland, 1986.
- 96. Net aboveground tree biomass of cull and salvable dead trees on timberland, by species group and diameter group, Kent/ Queen/Annes County, Maryland, 1986.
- 97. Net aboveground tree biomass of cull and salvable dead trees on timberland, by species group and diameter group, Montgomery/Prince Georges County, Maryland, 1986.

All Trees

Frieswyk, Thomas S.; DiGiovanni, Dawn M. 1990. Biomass statistics for Maryland--1986. Resour. Bull. NE-113. Radnor, PA: U.S. Department of Agriculture, Forest Service, Northeastern Forest Experiment Station. 138 P.

A statistical report on the fourth forest survey of Maryland (1986). Findings are displayed in 97 tables containing estimates of forest area, tree biomass, and timber volume. Data are presented by state and county level.

Keywords: Forest survey, inventory, area, volume, biomass.

Headquarters of the Northeastern Forest Experiment Station is in Radnor, Pennsylvania. Field laboratories are maintained at:

Amherst, Massachusetts, in cooperation with the University of Massachusetts

Berea, Kentucky, in cooperation with Berea College

Burlington, Vermont, in cooperation with the University of Vermont

Delaware, Ohio

Durham, New Hampshire, in cooperation with the University of New Hampshire

Hamden, Connecticut, in cooperation with Yale University

Morgantown, West Virginia, in cooperation with West Virginia University

Orono, Maine, in cooperation with the University of Maine

Parsons, West Virginia

Princeton, West Virginia

Syracuse, New York, in cooperation with the State University of New York, College of Environmental Sciences and Forestry at Syracuse University

University Park, Pennsylvania, in cooperation with The Pennsylvania State University

Warren, Pennsylvania
